It has been argued that the use of the term "cognitive" is not only redundant but also misleading. The term "cognitive" is used to describe mental processes that are not directly observable, such as thinking, reasoning, and problem-solving. However, the term "cognitive" is often used to describe a wide range of mental processes, including perception, memory, and emotion. This can lead to confusion and a lack of clarity in the literature. Some researchers argue that the term "cognitive" should be reserved for processes that are directly related to the structure and function of the brain, such as memory and perception. Others argue that the term "cognitive" should be used to describe a broader range of mental processes, including those that are not directly related to the brain. The use of the term "cognitive" is a topic of ongoing debate in the field of psychology.
